

PIC16(L)F18326/18346 Family Silicon Errata and Data Sheet Clarification

The PIC16(L)F18326/18346 family devices that you have received conform functionally to the current Device Data Sheet (DS40001839E), except for the anomalies described in this document.

The silicon issues discussed in the following pages are for silicon revisions with the Device and Revision IDs listed in [Table 1](#). The silicon issues are summarized in [Table 2](#).

The errata described in this document will be addressed in future revisions of the PIC16(L)F18326/18346 silicon.

Note: This document summarizes all silicon errata issues from all revisions of silicon, previous as well as current. Only the issues indicated in the last column of [Table 2](#) apply to the current silicon revision (**A3**).

Data Sheet clarifications and corrections start on [page 5](#), following the discussion of silicon issues.

The silicon revision level can be identified using the current version of MPLAB® IDE and Microchip's programmers, debuggers, and emulation tools, which are available at the Microchip corporate website (www.microchip.com).

TABLE 1: SILICON DEVREV VALUES

Part Number	Device ID ⁽¹⁾	Revision ID for Silicon Revision ⁽²⁾		
		A1	A2	A3
PIC16F18326	30A4h	2001h	2002h	2003h
PIC16LF18326	30A6h	2001h	2002h	2003h
PIC16F18346	30A5h	2001h	2002h	2003h
PIC16LF18346	30A7h	2001h	2002h	2003h

Note 1: The Device IDs (DEVID and DEVREV) are located at addresses 8006h and 8005h, respectively. They are shown in hexadecimal in the format "DEVID DEVREV".

2: Refer to the "PIC16(L)F183XX Memory Programming Specification" (DS40001738) for detailed information on Device and Revision IDs for your specific device.

For example, to identify the silicon revision level using MPLAB IDE in conjunction with a hardware debugger:

1. Using the appropriate interface, connect the device to the hardware debugger.
2. Open an MPLAB IDE project.
3. Configure the MPLAB IDE project for the appropriate device and hardware debugger.
4. For MPLAB X IDE, select *Window > Dashboard* and click the **Refresh Debug Tool Status** icon ().
5. Depending on the development tool used, the part number *and* Device Revision ID value appear in the **Output** window.

Note: If you are unable to extract the silicon revision level, please contact your local Microchip sales office for assistance.

The DEVREV values for the various PIC16(L)F18326/18346 silicon revisions are shown in [Table 1](#).

TABLE 2: SILICON ISSUE SUMMARY

Module	Feature	Item Number	Issue Summary	Affected Revisions ⁽¹⁾		
				A1	A2	A3
Oscillators	Fail-Safe Clock Monitor (FSCM)	1.1	The FSCM may fail to trigger with 4x PLL enabled.	X		
Host Synchronous Serial Port Module (MSSP2)	I ² C Communication	2.1	Acknowledge failure on LF devices only.	X		
Electrical Specifications	VDD Parameter	3.1	VDDMIN specifications are changed for LF devices only.	X	X	X
	ADC Offset Error	3.2	ADC Offset Error specification changed.	X	X	X

Note 1: Only those issues indicated in the last column apply to the current silicon revision.

Silicon Errata Issues

Note: This document summarizes all silicon errata issues from all revisions of silicon, previous as well as current. Only the issues indicated by the shaded column in the following tables apply to the current silicon revision (**A2**).

1. Module: Oscillators

1.1 Fail-Safe Clock Monitor (FSCM)

The Fail-Safe Clock Monitor may fail to trigger with the loss of the external clock signal when the 4x PLL is enabled. This includes all external clock modes, LP, XT, HS, ECL, ECM and ECH.

Work around

None.

Affected Silicon Revisions

A1	A2	A3					
X							

2. Module: Host Synchronous Serial Port Module (MSSP2)

2.1 I²C Communication

When using the MSSP2 to perform I²C communication and the voltage for VDD is above 3.0 volts, the Acknowledge signal (ACK) does not always occur after the second address byte is received, as expected. This issue exhibits itself when the MSSP2 is configured either for 7-bit or 10-bit addressing and in either Host or Client mode.

The issue occurs more frequently when using 10-bit addressing in Client mode and the lower address bits (A7-A0) are transmitted by the Host on the SDA line.

Work around

Do not exceed 3.0 volts on VDD when using LF device.

3. Module: Electrical Specifications

3.1 VDD Parameter

VDDMIN at -40°C to +25°C = 2.3V.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
 - Microchip believes that its family of products is secure when used in the intended manner and under normal conditions.
 - There are dishonest and possibly illegal methods being used in attempts to breach the code protection features of the Microchip devices. We believe that these methods require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Attempts to breach these code protection features, most likely, cannot be accomplished without violating Microchip's intellectual property rights.
 - Microchip is willing to work with any customer who is concerned about the integrity of its code.
 - Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable." Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
